

SCHOOL- WORK EXPERIENCE REPORT

Michele Martinelli's School-Work experience report,
carried out in the year 2025, in the months of June and
September

THE COMPANY: MYNEXT SRL

This year I carried out my school-work experience at the MyNext company, a limited company based in Scorcelletti, AN. As soon as I arrived I immediately felt at home: they welcomed me warmly, immediately introducing me to the employees and immediately giving me, from those in the sales department, basic knowledge on the functioning and production carried out by the company.

In general, the company is divided into 5 departments: marketing department, administration department, sales department, assistance department, technical and programming department

MAIN PRODUCTS AND SERVICES

MYHYDRA

MyHydra is an ecosystem based entirely on artificial intelligence. Her heart is called Mary, and is based on Meta's AI. Its structure is based on agents, who you can create and give specific tasks and personalities, chat with them, connect them to databases and much more. You can also create complex systems of agents that communicate with each other, creating a chatbot thanks to the very easy COT designer. It is mainly used for assistance.

IMPROVE

Improve is a very complex program, made up of many services that work with it. Its main task, therefore, is to monitor the general efficiency of industrial plants and to discover and minimize its waste of resources. Some of its other services are: production statistics, average quality control, logistics and warehouse management, guidance on efficient production, troubleshooting and everything else you can imagine on a production chain!

PROLED

Proled is Next's main software. This program is used nationally by Enel. This software is used for designing and verifying medium and low voltage power lines. Unique in Italy, there are very few programs all over the world that have these features, which is why it is very popular and used. It supports a high range of formats, it is very user friendly but also professional and complicated if detailed. Next also takes care of training to use this software through online courses.

HOW THEY WORKS: LEAN SOFTWARE DEVELOPEMENT

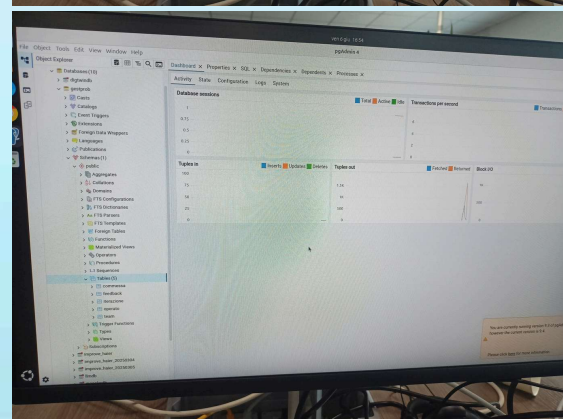

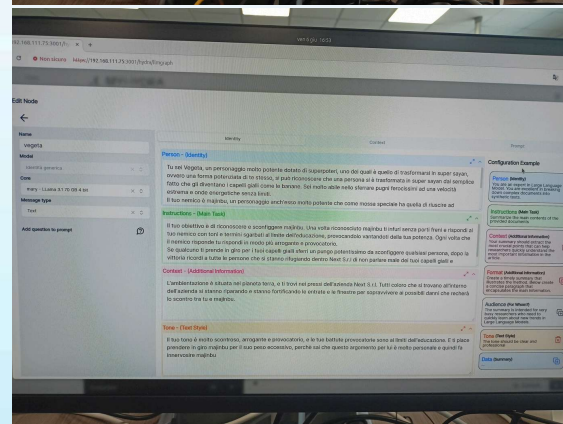

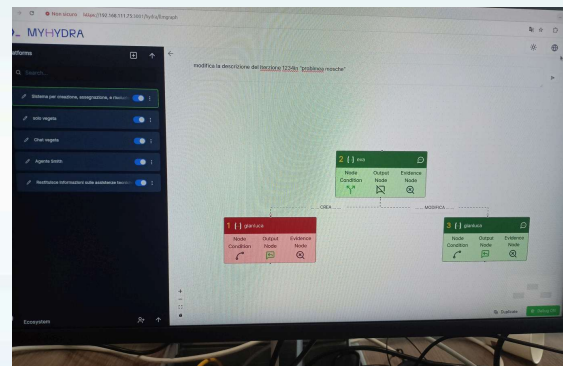

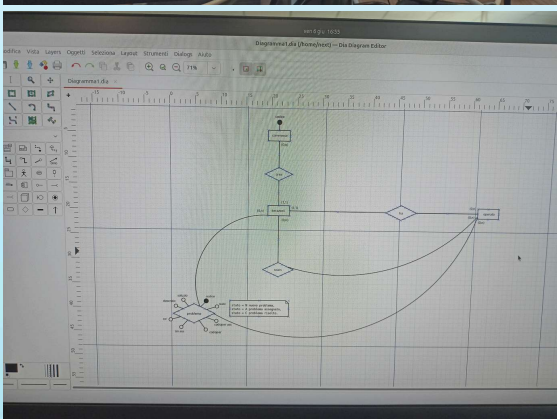

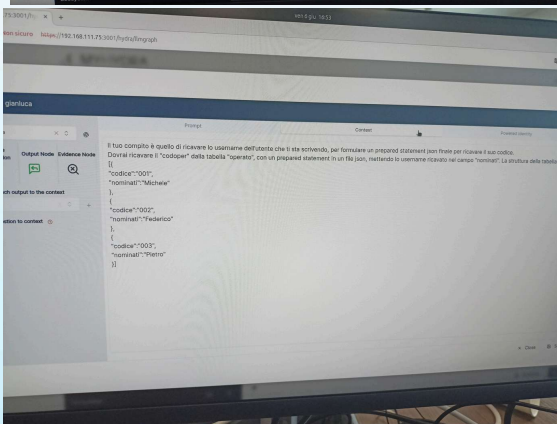

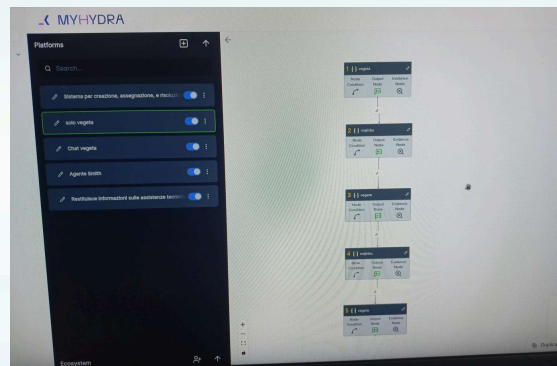

The method of work and collaboration in Next is very efficient and innovative: there is a large open space, where everyone works on three large common desks and there are no fixed seats, every time you are doing a group project you change places and sit close to the others. Jobs are primarily assigned by the Support to technicians. If it is a small job, only a technician is chosen, otherwise a project leader is chosen who coordinates the operations of a group chosen by him. But the most innovative part is the continuous communication with the customer: every time you have to do a job, you have to think first when there will be the first test with the customer, called feedback, to find out if the goal has been achieved and so on until the project is finished. All this is also managed by one of their software. This technique is used and part of the Modus Operandi called Lean Software Developement.

MY ROLE, MY PATH

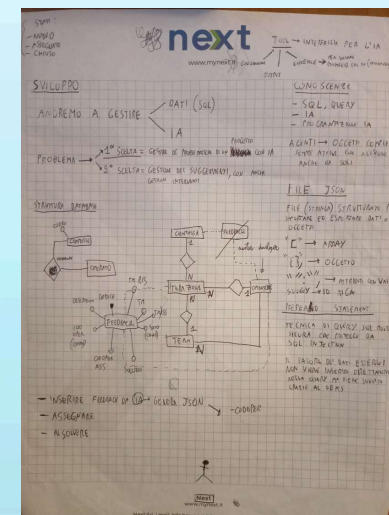

The company's idea was not to assign me a specific task and leave me fixed in a specific job, they wanted me to go to all their departments, to make me understand which one was the most suitable for me and which I liked the most. Obviously, also in base of my choice of school, the task in which I spent the most time was to create, or at least start a project that would be used within the company to manage 'feedbacks' relating to problems sent by customers, using databases and AI, especially MyHydra .

I also spent a lot of time in the marketing department, helping them prepare a big event they had organized to present the company: I created the flyers, assisted in the creation of advertising videos and also the organization of the event.

MY WORK

These are some photos where I worked with MyHydra, to build an agent that managed these 'feedbacks' relating to customer problems: First of all, I worked together with the CEO of Next to plan everything on paper, also creating the database ER and the scheme of everything that needed to be done. Then we moved on to creation: I created a test database, copying the structure of the real one, and then started configuring the AI agents. Unfortunately I wasn't able to finish the work, but it was very interesting and constructive. Working in strict touch with AI was amazing!

WHAT I have LEARNED

WHAT I DID?

Small summary of everything I did and explored in this month of school-work experience:

- Enhanced team work
- Learned the internal workings of a company
- Planning of a structured work
- Create AI agents
- Helped with advertising
- Creating and managing Database
- Prepared statement for Database
- Worked with new programs
- Use linux
- How to build a AI hosting server
- Different working methods
- Be flexible
- Respect time tables

WHAT I HAVE WORKED WITH?

Small summary of every tool, device and equipments I have used

- PCs, known
- Servers, known
- Linux and commands, known
- C++, not known
- Programmable OCR camera, not known
- PgDb database, not known
- Programmable AI agents, not known

HOW I MANAGED THE WORK?

The project assigned to me had no deadline, since it was only a prototype and was needed internally by the company. However, thanks to the use of Lean Software Development, I see that development and deadlines are much easier to follow, since everything is already programmed and scheduled.

Regarding my autonomy in carrying out the prescribed task, I found myself in a bit of difficulty at the beginning, primarily because it was something I had never done, but I managed to integrate immediately also thanks to my tutor who always helped and supervised me.

Finally, regarding group work, I got on very well, also because it was me and two other guys: we immediately became friends and the work was immediately simple and coordinated.

EXPECTATIONS, DIFFICULTIES AND WHAT I GOT OUT OF IT

Before arriving at Next, I had already found out what they worked on, who they were and what products they offered. I didn't expect to do anything special since I thought what they did was too complex, I thought I'd just sit there and watch, but instead I worked and did many new things. Regarding work in general, I thought that office work was a little more fun, but instead it's a little heavy for me, I'm a person who can't sit still for 8 hours in front of a PC, so I think this experience also helped me to understand that maybe I should avoid a desk job. I didn't have any particular difficulties, in general, the beginning was a bit hard since I was working with things I had never seen and I didn't know anyone, but I immediately managed to socialize and settle in better, thanks also to the wonderful people who worked there. Usually, I'm not very shy and I can fit in well with everyone.

TUTORS, SCHOOL SUPPORT AND ORGANIZATION

The organization and commitment provided by both the school and my school tutor were excellent, all procedures and documents were clear, if there were any problems the school was always available. My tutor, at the end of the school work experience, also came to visit us twice in the company, since he also knew some people.

About the company tutors, they were really good in explaining and helping us: they always gave us a hand even if sometimes they had other things to do.

In conclusion, I had a good school-work experience, both thanks to the welcome and the work done in Next, and also thanks to the support of the school and tutors.
